Introduction

The package **beamerposter** enhances the capabilities of the **standard beamer class**, making it possible to create scientific posters with the same syntax of a beamer presentation.
By now there are not many themes for this package, and it is slightly less flexible than **tikzposter**, but if you are familiar with beamer, using **beamerposter** don't require learning new commands.

Since the document class is **beamer**, to create the poster all the contents must be typed inside a frame environment.

preamble

poster size: a0, a1, a2, a3 and a4, but the dimensions can be arbitrarilly set with the options **width=x, height=y**.
scale: scale the fonts

Column1

- first
- second

Column2

- third
- fourth
